

Global climate agreement.

good decisions

Decision.

A strong international agreement to rapidly reduce greenhouse gas emissions has been adopted. Countries have set binding targets and concrete plans for energy, transport and industry.

Result.

More than 190 countries participate in a global emissions reduction plan.

Renewable electricity.

good decisions

Decision.

Solar and wind energy have become the main sources of electricity in many countries. Fossil fuel power plants are rapidly disappearing.

Result.

More than 70% of global electricity now comes from renewable sources.

End of fossil fuel subsidies.

good decisions

Decision.

Government subsidies for oil, gas and coal have been abolished. Public funds are now redirected toward renewable energy and clean technologies.

Result.

Global CO₂ emissions dropped by more than 20% in ten years.

Large reforestation programme.

good decisions

Decision.

Countries and cities have launched an unprecedented global reforestation program. Forest ecosystems are being restored on a massive scale.

Result.

Over 1 trillion trees have been planted, absorbing billions of tons of CO₂ every year.

Climate education in schools.

good decisions

Decision.

Governments introduce climate education as a mandatory part of school curricula. Students learn how climate change works, how it affects everyday life, and what solutions exist. Climate topics are included in different subjects and connected with real-life examples and local environmental actions.

Result.

New generations grow up climate-literate, better prepared to make responsible choices about energy, food, consumption and the environment.

Global climate solidarity fund.

good decisions

Decision.

An international solidarity fund helps countries most affected by climate change invest in protection and adaptation. Wealthier countries contribute financially to help vulnerable regions adapt to rising temperatures, extreme weather, water shortages and sea level rise. The fund supports climate-resilient infrastructure, early warning systems, sustainable agriculture and access to clean energy.

Result.

More than 300 billion Eur per year supports vulnerable communities. Communities most exposed to climate impacts gain resources to adapt and recover, reducing inequality and strengthening global cooperation in addressing climate change.

Climate education for citizens.

good decisions

Decision.

Governments and local authorities launch large-scale climate education programs for adults. Through public campaigns, community workshops, media programs and accessible online courses, citizens learn how climate change affects their lives and what actions they can take.

Result.

Climate literacy becomes widespread. Citizens make more informed choices, support ambitious climate policies and actively participate in building a low-carbon society.

Global CO_2 tax.

good decisions

Decision.

A universal carbon tax now applies to industry, energy and transport worldwide. The more emissions produced, the higher the cost.

Result.

Companies rapidly switched to clean technologies and emissions fell by more than 30%.

I will plant a plant.

good decisions

What to do?

Plant a tree, a flower, or create a small garden on the balcony.

Why it matters?

Plants absorb CO_2 and cool the environment.

Quick tip:

Plants like mint, tomatoes, or basil grow easily even on a small balcony.

My little energy audit.

good decisions

What to do?

Go through your home and check where you use the most energy (lights, heating, appliances in standby mode). Write down two things you can change today.

Why it matters?

Reducing energy consumption reduces CO₂ emissions.

Quick tip.

Unplug chargers from the socket when you're not using them - and that's when they use electricity.

Conversation that drives change.

good decisions

What to do?

Talk to one person about climate change and ask them what they think and feel.

Why it matters?

Conversation can drive behavioral changes.

Quick tip.

Start with the question: *What have you noticed has changed over time?*

My week without wasting food.

good decisions

What to do?

Try planning your meals for a week so that you don't waste food.

Why it matters?

Food waste creates methane - a powerful greenhouse gas.

Quick tip.

Keep leftovers in a visible place in the fridge - that way you'll eat them sooner.

Food waste laws.

good decisions

Decision.

Governments introduce strict laws to reduce food waste. Supermarkets and restaurants are required to donate surplus food or convert it into compost or energy.

Result.

Supermarkets are fined if they throw away edible food instead of donating it. Because of these policies, the amount of food waste is reduced by 50%.

Alternative proteine regulations.

good decisions

Decision.

New regulations require that at least 50% of meat on the market comes from plant-based or lab-grown alternatives. Industrial animal farming has been significantly reduced.

Result.

Emissions from meat production have dropped by more than 35%
